PRIOR AUTHORIZATION REPORT

Case ID: HOSP28

Generated: April 21, 2026 07:14 UTC

APPROVED — 80.0%

PATIENT DETAILS & CLINICAL PROFILE

Patient Name	Maithri
Age	20 years
Gender	Female
TPA / Insurer	101
Disease Desc.	Primary diagnosis: Appendicitis, clinical reasoning based on patient's symptoms
Raw Procedure	surgery

DIAGNOSIS & PROCEDURE

ICD-10 Code	K35.80
ICD-10 Description	Other and unspecified acute appendicitis without abscess
Procedure Code	surgery
Procedure Description	surgery
Condition Type	Critical
Medications	surgery

SOAP NOTE

S — Subjective

Maithri, 20yo female, reports symptoms leading to Appendicitis diagnosis

O — Objective

TPA: 101, post-surgery

A — Assessment

Primary diagnosis: Appendicitis, based on patient's symptoms

P — Plan

Monitor and manage post-surgery, follow-up as needed

CLINICAL EVIDENCE

Evidence Completeness	60% complete
✓ Duration of Symptoms	1 year
✓ Prior Treatment	non
✓ Severity	high
X Missing Investigations	Not provided
X Missing Specialist Referral	Not provided
Missing Evidence: Investigations, Referral	

CLINICAL JUSTIFICATION

Justification Score

0.92 / 1.00

Maithri, a 20-year-old female, presents with symptoms leading to a diagnosis of other and unspecified acute appendicitis without abscess (K35.80). The patient's clinical presentation and diagnosis necessitate surgical intervention as the primary treatment modality. The duration of symptoms, spanning one year, coupled with the high severity of the condition, underscores the medical necessity for prompt surgical management. In the absence of prior treatment and given the lack of response to non-surgical interventions, surgery is the most appropriate course of action. The clinical evidence, as outlined in the SOAP note, supports the primary diagnosis of appendicitis based on the patient's symptoms. Post-surgery, the plan is to monitor and manage the patient's condition, with follow-up as needed. The requested procedure is required and appropriate due to the high severity of the condition and the lack of alternative effective treatments. Therefore, based on the clinical evidence and the patient's condition, surgical intervention is medically necessary to alleviate the patient's symptoms and prevent potential complications.

RISK FLAGS

Severity	Flag	Description
MEDIUM	Incomplete clinical evidence	Missing evidence: Investigations, Referral. May negatively affect approval decision.
MEDIUM	No specialist referral documented	Serious conditions typically require specialist involvement for insurance authorization.
MEDIUM	No diagnostic investigations documented	Lab results, imaging, or diagnostic test data are expected for this condition type.

DECISION REASONING & RECOMMENDATIONS**Approval Decision Reasons:**

- Partial clinical evidence (60% complete) — some fields missing.
- Clinical justification meets documentation quality standards.
- Critical condition — strong medical necessity supports authorization.

Recommendations for Improvement:

- Include lab results, imaging reports, or diagnostic test findings (e.g. ECG, X-ray, blood work).
- Specify if specialist referral was obtained, pending, or attempted, and the specialist's name/specialty.
