| X Missing Specialist Referral                               | Not provided |
| Missing Evidence: Prior treatment, Investigations, Referral |              |

### CLINICAL JUSTIFICATION

**Justification Score**

0.92 / 1.00

Umarani, a 50-year-old female, presents with a primary complaint of heart disease, diagnosed as atherosclerotic heart disease of native coronary artery without angina (I25.10). The patient's symptoms have persisted for 1 year, indicating a chronic condition that necessitates immediate medical intervention. The severity of her condition is classified as high, underscoring the urgency for surgical treatment. As noted in the SOAP note, the assessment confirms heart disease with possible coronary artery disease or cardiomyopathy, and the plan unequivocally states that surgery is required for treatment. Given the lack of prior treatment and investigations, coupled with the absence of specialist referral, surgical intervention is the most appropriate course of action. The clinical evidence supports the medical necessity of surgery to address Umarani's heart disease effectively. Therefore, based on the provided clinical evidence and the patient's condition, surgery is not only necessary but also the most suitable treatment option to prevent further complications and improve her quality of life.

**RISK FLAGS**

| Severity | Flag                                    | Description                                                                                                                        |
|----------|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| MEDIUM   | Incomplete clinical evidence            | Missing evidence: Prior treatment, Investigations, Referral. May negatively affect approval decision.                              |
| HIGH     | High-acuity diagnosis                   | ICD-10 I25.10 indicates a serious/complex medical condition. Comprehensive supporting documentation is critical for authorization. |
| MEDIUM   | No specialist referral documented       | Serious conditions typically require specialist involvement for insurance authorization.                                           |
| MEDIUM   | No diagnostic investigations documented | Lab results, imaging, or diagnostic test data are expected for this condition type.                                                |

**DECISION REASONING & RECOMMENDATIONS****Approval Decision Reasons:**

- Insufficient clinical evidence (40% complete) — most fields missing.
- Clinical justification meets documentation quality standards.
- Serious medical condition documented — supports approval decision.
- High-severity risk flags detected: High-acuity diagnosis.

**Recommendations for Improvement:**

- Describe previous treatments tried and their outcomes (e.g. medications, physiotherapy).
- Include lab results, imaging reports, or diagnostic test findings (e.g. ECG, X-ray, blood work).
- Specify if specialist referral was obtained, pending, or attempted, and the specialist's name/specialty.
- Complete all Clinical Justification fields for significantly better approval odds.
